Enes Batuhan AY

For this project first, I used my old PHP codes for basic admin, user, log in, log out, error, or some sessions.

First I made a users table and add users inside with their information...I add a payment user so user's payment can behold. I add an admin panel. And admin check inside files so user or admin can go his pages.

Second, i added an apartment block. Inside of apartment block, I added door numbers with their flees and rents.

Third, I added an actions table. I connect the action table with the user table in PHP codes. I did all math operations from here.

I added an expense database so i can add expenses and show them to users or admin
